

Managed SASE

Speed is a luxury, but security is a necessity. Don't gamble with either. Modernize your network today with Managed SASE.

Traditional VPNs and perimeter firewalls were built for a single office. With a distributed workforce, that model breaks, resulting in slow, inconsistent, and hard to secure remote access.

Secure Access Secure Edge (SASE) fixes this by moving security to the cloud edge, right where users, devices, and apps connect. By enforcing identity-based access and protection everywhere, SASE delivers fast, consistent, secure connectivity from any location.

Our Solution

IT Weapons' Managed SASE service delivers enterprise-grade security and networking to your users, enabling your workforce to have seamless connectivity wherever they are. While SASE can be complex to configure correctly on your own, ITW partners with you to design, deploy, and continuously manage your environment.

Benefits

Enhanced security capabilities: A combination of secure web gateways, cloud-based firewalls, and AI threat detection ensures that your organization's perimeter remains secure.

Zero-trust model: Every login, device, and access request is continuously verified for trust, delivering cutting-edge network security.

Improved connectivity: Instead of maintaining one expensive fixed connection, your data is routed intelligently, picking the fastest and most reliable path at any given moment.

Peace of mind: Gain access to dedicated experts who can handle your network security architecture for a fraction of the cost of an in-house team.
